They are encoded by open reading frames (ORFs) AAZ11972-Z1258. The antigenic proteins, their fragments, their nucleic acids acids are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The HXUC protein (AAW01462, see also AAW01461) of nontypeable Haemophilus influenzae (NTHI) strain N182 is a 78 kDa outer membrane protein involved in the utilisation of low levels of free haem. It shows homology to TonB-dependent outer membrane proteins of other bacteria, and was identified from an open reading frame (see also AAT44520) isolated by PCR amplification. Another outer membrane protein, HXUB (AAW01465, see also AAW01464), was similarly identified. Recombinant HXUC and HXUB proteins can be prepd. in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genes encoding H. influenzae HxuC and HxuB surface-expressed protein(s) - useful in the prepn. of vaccines for children against H. influenzae infection

The DNA and probes derived from it may be used for the cidentification of H. pylori in a sample, and the diagnosis of the pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences, and can be used to prevent the classification of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORP of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely the pylori antigens for vaccine development, the amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                                    protein (OMP) having a terminal Phe residue.

Che protein may be used in a vaccine to prevent or treat H. pylori Che protein may be used in a vaccine to prevent or treat H. pylori Che infection or to identify H. pylori polypeptide binding compounds, to infection or to identify H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of Che pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and Che used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported interest particular various of the least of the predicted sequences of interest particular various of the predicted coding regions.
                                                                                                                                                                               Best Loc

Parent No. 614046

Patent No. 614046

Patent No. 614046

GENERAL INFORMATION:
TITLE OF INVENTION: Production of polyunsaturated fatty acids by expression TITLE OF INVENTION: of polyketide-like synthesis genes in plants
TITLE OF INVENTION: of polyketide-like synthesis genes in plants
TITLE OF INVENTION: of polyketide-like synthesis genes in plants
CURRENT APPLICATION NUMBER: US/09/090, 793

CURRENT FILING DATE: 1998-06-04

EARLIER FILING DATE: 1997-06-04

NUMBER OF SEQ ID NOS: 66

SOFTWARE: PatentIn Ver. 2.0

SEQ ID NO 5

LENGTH: 970
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       10;
